Results:

I don't have much interesting to talk about in my results other than that it seems that because the resolution is much higher, the edges are much finer and thinner, therefore it becomes more difficult to see any of the edges separately in either of the individual horizontal or vertical edges. I know this is not the purpose of this lab but I also think it's wild, how computationally intensive this can be for computers that are only seeing in a limited resolution, but our brain does this 24/7 in a much more efficient and higher resolution way.
